VICTORIA - The mushiness of our thinking about drugs is astonishing.

Substance abuse will cost every British Columbian -- man, woman and child -- more than $1,400 this year, according to a recent report.

The study was the first attempt in a decade to nail down the cost of substance abuse in Canada. It found that the problem cost Canada $39.8 billion in 2002, about 2 1/2 times more than we spend on defence.

Most Canadians accept the moral obligation to help people who are suffering -- not just the people abusing substances, but their families and friends and neighbours.

But leave that aside. The economics of addiction point unarguably to investments in prevention, treatment and harm reduction. The business case is clear: Significant investments now will produce greater savings in coming years.

We barely comprehend the problem. Many readers have likely made it to this point in the column assuming that it's about harm from street drugs.

But the centre adopted an economic definition, holding that abuse occurs any time use of a substance imposes greater costs on society than it does on the individual user. By that measure, alcohol and tobacco are by far the greatest problem substances.

The study found that tobacco abuse created direct and indirect costs of $17 billion; alcohol $14.6 billion; illegal drugs $8.2 billion. The numbers are staggering, but so are the opportunities.

B.C. has the fourth-lowest per-capita cost attributable to tobacco among Canadian provinces, at $563. But if we could match Ontario, which has the lowest cost among provinces, our tobacco-related costs would fall by $252 million.

Alcohol abuse cost B.C. slightly less, at $536 per capita, but that's still the second highest among the provinces. Ontario has the third-lowest cost in the country. If B.C. could match its performance, we would cut costs by $393 million.

And illegal drugs cost B.C. significantly more per capita than any other province. Bringing costs in line with Ontario -- which still has the fourth-highest costs -- would save $505 million.

It's not a question of ending abuse, or even aiming for some breakthrough. If B.C. could find a way to hold the damage from substance abuse to the same level as Ontario or a comparable province, costs would have been $1.1 billion lower in 2002.
The benefits would be sweeping. The study, supported by federal and provincial governments, found substance abuse resulted in $24.3 billion in lost productivity costs, $5.4 billion in law enforcement costs and $8.8 billion in health care costs. (About 20 per cent of acute care hospital days result from substance abuse.)

Remember, we're not talking about eliminating substance abuse, or even making radical progress. Just modest improvements would save us more than $1.1 billion a year.

Anyone in business knows that kind of return justifies a major investment. It simply makes economic sense.

Instead we fumble along, with occasional bursts of commitment and much more denial and dithering. Defenders of the status quo are quick to trot out spending on this program or that project. But the study, while warning of the difficulties in making comparisons with the results of a decade ago, concludes things have gotten worse. Deaths and number of days spent in hospital as a result of substance abuse have increased, as have other costs.

If we're doing such a good job, why are we going backward?

The biggest reason is an ugly combination of wilful blindness to the evidence about what works and a determination to rely on vague and unstated moralism instead of pragmatism and common sense. (But that reason goes unstated, because it's impossible to develop an effective moral argument for allowing people to suffer and die needlessly.)

Which leads inevitably to Prime Minister Stephen Harper's willingness to ignore the evidence that Vancouver's safe injection centre has saved lives, made the community safer and resulted in more addicts entering rehab. Despite those findings, Harper is still considering cutting off funding to the centre. His opposition has stalled plans for a badly needed safe injection centre in Victoria.

It should be enough that we can save lives and reduce suffering by tackling substance abuse. But if that's not enough reason, there remains a compelling economic argument for investing heavily in prevention, treatment and harm reduction.

Or we can stay on the same course and wait for another study in 10 years to tell us that we are wasting even more money and lives.
